METHODS, SYSTEMS AND COMPUTER PROGRAM PRODUCTS FOR REQUESTING WIRELESS TELEPHONY APPLICATION (WTA) PROTOCOL BASED ACTIONS

ABSTRACT OF THE DISCLOSURE

Methods, systems and computer program products are provided for requesting WTA protocol based actions. A request may be received for execution of the WTA protocol based action by a target mobile terminal that has a WTA agent. The request

5   may include an identification code that identifies a destination device for the WTA protocol based action. The identification code that identifies the destination device may then be associated with a Uniform Resource Locator (URL). A push command including the URL may be generated at a server. The push command may then be transmitted to the target mobile terminal to initiate the requested WTA protocol based

10   action by the WTA agent of the target mobile terminal. The WTA protocol based action may involve initiation of a call from the target mobile terminal to the destination device or repeatedly initiating calls from the target mobile device. The URL may or may not be associated with the identification code and the WTA protocol based action may or may not involve automatically accepting a call at the target

15   mobile terminal.
